

Blend Type Setup

Setting up blend types from scratch can be a little daunting so we've added some basic blend types to your agre database that you can use as a 'template' to modify or copy.

Caution Once you've used a blend type to make a blend there will be some fields that cannot be changed, so taking a few extra minutes up front to make sure everything is setup the way you want it may save you quite a bit of time later.

Tip If you aren't using **blend charges** now but think you may in the future, Tronia recommends setting up blend types with a blend charge product priced at \$0. You can change the price of a product at any time, but agre won't allow you to add a blend charge to a blend type that's already been used.

Blend Nutrients

Help

For details on how to work with [Blend Nutrients](#), please refer to the *Blending* chapter of **online Help**.

Before you can start setting up blend types, all the nutrients you use will need to be defined.

Blending > Manage > Blend Nutrients

Dry Blends (scaled and volumetric)

Setting Up Dry Blend Products

Help

For more details on how to [setup products](#), please refer to the *Inventory* chapter of **online Help**.

On the **Products tab**, they must be flagged as an *Inventory Item* and be *Blendable*.

Inventory > Manage > Products

On the **Units tab**, you need to include all units you'll use with your blender. The **main unit type must be the same as the Blend Type main units**. Most of the time, MT alone will be adequate, unless your blender is scaled in kilograms or pounds. If you're using a volumetric blender, you will need two matching unit types – main units and scale units.

Inventory > Manage > Products

The **Inventory**, **Notes**, and **Associated Products** tabs can be left as is. The **Blending** tab, however, is crucial:

Setting Up Dry Blend Types

agrē comes with at least one blend type already configured for you. Have a look and see how it is set up:

Blending > Manage > Blend Types

Blend Type tab

The **Blend Type** tab outlines the units and conversion factors you'll be using most of the time:

include add'l prods in blend in calculation of application rate?

seed addition affects Guaranteed Minimum Analysis (NPK, Blend Name only)

Projects set at the product level are not retained in blends

if you want a Project associated to a blend, set it at the Blend Type level

Caution **Main Units** and **Conversion** factors cannot be changed once the blend type has been used to Make a Blend.

Main Unit is the measurement unit for the completed blend (the total amount that is made is calculated in these units). For scaled blenders, it's usually **Metric Tonnes**. If you work in other units, just change these to whatever it is you commonly use, and modify the conversion rates appropriately.

Field measurement is a unit of area – usually acre, but could be hectare – and is the unit of measurement for the broadcast area.

Nutrient rate unit is the unit in which the quantity of nutrient per unit of broadcast area is measured – kilograms or pounds – so that you end up with kilograms per hectare, or pounds per acre. You must specify how to convert the nutrient rate unit to main units – the conversion factor is Nutrient Rate Unit / Main Units (in this example, there are 2204.6226 lbs per MT).

Application Rate Unit is the quantity that is spread over the field – this might be a dry or liquid measure, depending on the finished product.

The **Decimal** fields specify the number of decimals to be used for the relevant data item. Decimal values must be 4 or less.

Tip

Unit Price Decimals affect how much rounding occurs on the price per main unit (the more decimals, the less rounding), but the total price (quantity*unit price) will always have 2 decimals no matter what value is typed here.

Check **Include Additional Products in Application Rate** to include additional products in the application rate on the Batch Sheet and Price Sheet.

Additional product must be **Included in blend**.

Check **Show As Metric: Application Rate Metric Units** to display application rate in metric.
1 lb/ac = 0.186 kg/ha

☒ Show as Metric: Application Rate Metric Units: * Conversion:

In the **First Filler Product** box, enter a primary filler product you want to use for the blend type.

Enter the **Secondary Filler Product** and the **Threshold** percentage for when to add it.

Filler products are used only for the blend name or calculation method when the guaranteed analysis is exceeded.

Check **Allow Nutrient Max Option?** to set *maximum* NPKS values instead of *minimum* NPKS values.

An extra column will appear on **Make a Blend** allowing you to **Limit** the amount of one or more nutrients. It's not foolproof (the calculation has to balance using the selected products, so the value could still be exceeded), but it should get you closer to your targets.

Nutrient Requirements: Use Split Sources? ☐

Nutrient	lb per acre	Limit
N - Nitrogen	0	☐
P - Phosphorus	0	☒
K - Potash	0	☒
> S - Sulphur		☐
*		☐

x
↑
↓

Check **Allow Additions of Seed** to have added seed product affect the guaranteed minimum analysis.

(NPK and Blend Name only)

When you check **Include Seed** and calculate a blend, you'll be prompted to select the seed product and quantity details.

Select the **Allow Suspensions?** check box if this is a liquid blend type using suspensions. (not applicable to Dry blend types)

Select the **Project** to which all blends made with this type should be associated. (projects associated with blend commodities [46-0-0, 11-52-0, etc.] are not carried over to blends)

Blend to Grade

When you make a blend using a **blend name** or **guaranteed analysis** calculation method, you may ask for an analysis that isn't possible using the products listed. The analysis may be either unattainable (e.g., 90-90-90) or too low using the products listed (e.g., 7-7-7). If the analysis isn't attainable, agrē provides you with a blend that achieves the desired ratios and the attained guaranteed analysis (e.g., 17-17-17). However, if the analysis given is too low, agrē gives you the option to "blend to grade" by using **Filler Products**. For each of your blend types, you can optionally specify default filler products.

The **Filler Products** must be inventory items, must be blendable, must be active, and must have the same unit type (either main or alternate, and volume units if applicable).

Note Filler products are only used if you are **calculating** a blend **based on blend name or nutrient rate** and the guaranteed analysis is exceeded.

When you calculate the blend, you'll be asked if you want to add the filler product.

Make a Blend > Calculate Blend

Once you click **Use Selection**, the blend will be calculated using enough filler to bring the analysis down to grade.

Nutrient Defaults tab

When you are calculating blends, it can be handy to have the system provide default products for the nutrients you request in the blend. The **Nutrient Defaults** tab lets you set up those defaults, but at **Make a Blend** time you can change to a different product if you wish:

Blend Name: 1.1N-0.6P-1.4K-2.7S-0.6B-0.6Cu-0.6Ca-0.6Fe-0.6Mg-0.6Mn-0.6Se-0.6Zn

if checked, all nutrient codes are included in blend name

Blend Name: 5-4-4-8-0-4-0-4-0-4-0-4

if not checked, only values are included

N, P and K are always there, always in that order, and always required.

Other nutrients can be made **required** – these will always display in the blend name (even if 0), in the order specified (if it is required, it must have an order). There can be **no gaps between required nutrients** (the numbers must be consecutive, you can't have a non-required nutrient before a required one in the sequence). This effectively means that required nutrients must be N, P, K and then whatever other nutrients you want required, followed by any optional nutrients for which you'd like to specify the order of appearance.

A nutrient that is *not* required can have an order number – this will be the 'starting point' for the order when on **Make a Blend** – and will be included in the blend name only if the value is greater than 0.

Note When calculating a blend, all non-required nutrients can be moved around – the order is just a starting point.

Tip You can **add** a **nutrient** or a **product** on the fly with the buttons at the bottom.

You can **remove** the selected nutrient from the list with the **Remove Nutrient** button (as long as it isn't N, P or K).

The **default product** will be added to the Products in Blend grid on the Make a Blend form whenever you add this nutrient to a blend of this blend type. It's just a default, though, you can remove it and replace it with another product on the fly if you want. The product you define must contain the nutrient in its product definition (see [Adding Products](#) / Blending tab in online Help).

If you commonly create blends with different 'default products' (say, a slow-release nitrogen instead of straight 46) you might want to create a new blend type for that sort of blend. The new blend type can have slow-release product as the default for nitrogen, saving you from having to change out the product each time you make a slow-release blend.

Tip If you decide to create another blend type almost like this one but with small changes (maybe with different default products, or without a blend charge), you can copy the blend type by clicking **Copy**.

Blending > Manage > Blend Types

Batch Sheet Settings tab

The **Batch Sheet Settings** tab is where you define the conversion rates between your scale units and your main blend units, as well as the maximum size of your blender and the order in which you want products to be put through the blender.

	412	412	412	1236

Worksheet

Worksheet, Percentages, and Blend Notes: check the ones you'd *usually* like to see on each batch sheet (these are just defaults; you can uncheck them on a blend-by-blend basis).

Force Equal Batches can also be changed on the fly when you are making actual blends.

The only **Products** that will show on this list are **active, blendable** and have the **main unit type defined** on the product.

The idea is to list the products in the order you want them added to the blender – this will affect the order that the products show up on the batch sheet. Ties are allowed. Anything that should go in first should have a low number (like 1) and anything that should go in last should have a high number (like 9). Any product that isn't in the list will be placed second last (but only when there is a qualified "last" product to be used).

If you don't specify a **Product Order**, they will be listed in the same order you see them on the Calculation tab when you are making a blend.

For Volumetric Blenders

First you'll need a bin for *each product* you use in a blend for *each location* that that has a volumetric blender.

Blending > Manage > Bins

Bin description is required and must be unique *per location*.

You can have multiple bins with the same description as long as they are in different locations.

The **Final Factor** is the rate that the product comes out of the bin (e.g. in kg/rpm). If a bin can output 0.3765 kg per rpm, set the final factor to be .3765. Basically, this means that for each tick of the dial (revolution), this amount of product will be output per minute. So set the dial to 100 and you would get 37.65kg/minute output from the given bin.

Note

Keep track of the bin units that you are using, as you need to specify the **conversion factor** between units of final factor and main units of the blend type (done on the blend type).

For example, if you are using KG as the units for the final factors, and the main units of the blend type is MT, then the final factor conversion for the blend type is 1000 (1000 kg in a tonne).

The Batch Sheet tab for **volumetric blenders** is just a bit different.

Exit

Bin	Bin Order
StonyNitrogen1	1
StonyNitrogen2	2
StonyPhos	3
StonyPotash#1	4
StonySulphur	5
StonyPotash#2	6

Add Bin Remove Bin Order

Bins will be listed in this order on the worksheet

Conversion factor: This converts the final factor units to main units. This is the conversion from the units used in the bin final factor to the main units for the given blend type. For example, if the final factors are calculated based on kilograms and the blend type main units are in tonnes, the final factor conversion is 1000 (1000 kg in a tonne).

Maximum dial: This is the maximum setting (rpm) on the blending equipment. Typically the dials can be set from 0 to 1000 but often times the manufacturer may recommend a maximum setting of say 900 or 990, etc. The dial settings control the speed of the augers (typically represent rpm – revolutions per minute). When the system calculates the batch settings, it will take the maximum dial settings into consideration and will not assign a dial setting higher than this number.

Max throughput per hour: This represents the maximum amount of blended product that can be output per hour. This is measured in main unit type. Note that each bin has an auger (or multiple augers) and has its own maximum capability (the maximum dial setting). If all augers ran at their maximum capability, likely the system would be overloaded. The system itself has a maximum throughput for all products/bins combined. When the system calculates the batch settings, the maximum throughput is considered and the dial settings are adjusted to make sure that the maximum throughput isn't exceeded.

Max Blend Size (in main units) is normally the capacity of the vehicle/trailer/container into which the blend is loaded. Since this can change for every customer, you may want to leave it blank.

Force Equal Batches by default can be changed on the fly when you are making actual blends.

Only **Bins** in the same Location can be selected.

Price Sheet Defaults tab

The **Price Sheet Defaults** tab tells agrē what commodity pricing to print - by default - on the Price Sheet.

set defaults in Manage Blend Types

same boxes checked in Make a Blend check/uncheck on the fly

Tip

These settings are just defaults - you can change the show/hide status of each price on the **Make a Blend Price Sheet tab** before you print.

TSL Custom Ag & Fuel Inc.

Blend Price Sheet

BLEND018

Customer: Alexander Carter (C0874)
 Box 14
 #7 Arden County Road
 Dog River Saskatchewan S0G 4H0 306.552.1903

Date: Apr 02, 2020
Blend Type: Drys 8MT blender

Blend Name: 19-17-19 (19.00-17.33-19.99)

Field(s):

Total Price	\$767.97
Price/acre	\$19.20

4 Notes: Text typed on the Blend Notes tab is displayed here.

Blend Charges tab

If your company charges a fee for blending, that can be set up on the last tab:

Caution ***Blend Charge Product*** cannot be changed once the blend type has been used to Make a Blend (but the price of it can be changed at any time).

There may be a ***Blend Charge Product*** already set up in your database called “Blend Charge” – if so its price has been set to \$0 but [can be changed](#).

Show Blend Charge On: you can display the blend charge only where you want the customer to see it.

Optional Surcharges can be added based on:

- the number of products in the blend
(e.g. you'll mix 4 products for free, but add any more and there'll be additional charges)
- product type
(e.g. the customer wants seed added to the blend which means you'll need to be compensated for the extra time spent to clean out the blender afterwards)

Liquid Blends

Note Much of the liquid setup is the same as dry, so mainly what's different for liquids will be covered here. Head back up to the [Dry Blends section](#) for more details about the fields and settings common to both types.

Setting Up Liquid Blend Products

You will need to setup *each* product that will be used in liquid blends.

- On the **Units tab**, MT (or whichever Main Unit is specified on the blend type) is required, but products also need a unit type to reflect the volume. Add your liquid **Unit**, usually GAL (either US or Imperial but keep it consistent for all products), along with the applicable **Conversion Factor to Main**.

Units	Main Units?	Conv. Factor to Main	Company Retail Price	Active?
MT - Metric Tonne	☒	1.00	\$464.00	☒
ImpGal - Imp. Gallons	☐	172.858363		☒
L - Litre	☐	785.83		☒
USGAL - US Gallons	☐	207.5943		☒
>	☐			☐

Note Different products will likely have different conversion factors.

- Fill in the **Blending tab**.

Density: ...

Product Makeup:

Setting Up Liquid Blend Types

Blend Type tab

Since blend types are setup usually by location, if you have a liquid blender in more than one location you will likely want to setup a blend type for each one.

The screenshot shows the 'Add Blend Type' dialog box with the 'Blend Type' tab selected. The dialog has a title bar with a green checkmark icon and buttons for 'Save', 'Refresh', and 'Exit'. Below the title bar are tabs for 'Blend Type', 'Nutrient Defaults', 'Batch Sheet Settings', 'Price Sheet Defaults', and 'Blend Charges'. The 'Blend Type' tab contains the following fields and options:

- Blend Type Code:** LIQUID (with a red asterisk), ☒ Active
- Description:** Liquid Blend Type
- Location:** Dog River (dropdown menu)
- Blend Name Decimals:** 0, 2, 4 (spinners)
- Main Units:** MT - Metric Tonne (dropdown), Decimals: 3 (spinner)
- Volume Units:** USGAL - US Gallons (dropdown), Decimals: 3 (spinner)
- Field Measurement:** AC (dropdown), Decimals: 0 (spinner)
- Nutrient Rate Units:** LB (dropdown), Decimals: 0 (spinner)
- Application Rate Units:** USGAL (dropdown), Decimals: 3 (spinner)
- Conversion:** 2,204.6 (for Nutrient Rate Units), 1 (for Application Rate Units)
- ☒ Convert Application Rate Units to/from Liquid?
- Filler Product:** (dropdown), Add Product button
- ☐ Allow Nutrient Max Option?
- ☐ Allow Additions of Seed Products
- ☐ Allow Suspensions
- Project:** (text field)

Annotations with red arrows point to the following fields:

- A box pointing to 'Volume Units' and 'Application Rate Units' contains the text: "Volume Units must equal Application Rate units".
- A box pointing to the 'Convert Application Rate Units to/from Liquid?' checkbox contains the text: "check if you want the blend calculated in GAL/acre instead of LBS/acre".
- A box pointing to the 'Project' field contains the text: "Projects set at the product level are not retained in blends if you want a Project associated to a blend, set it at the Blend Type level".

Caution **Volume Units** and **Convert Broadcast Rate Units to/from Liquid** cannot be changed once the blend type has been used to Make a Blend.

Batch Sheet Settings tab

Show Gallons

Note If you want the batch sheet to show **metric tonnes**, leave the **Convert Scale Units to/from Liquid?** checkbox *unchecked* - see **page 19** for an example.

On the **Batch Sheet Settings tab**, specify the **Scale Units**, **Conversion factor**, (which is the conversion factor between the Volume Units and the Scale Units) and default **Products**.

Since you want the batch sheet to show **gallons** instead of metric tonnes, check the **Convert Scale Units to/from Liquid?** checkbox.

The screenshot shows the 'Add Blend Type' dialog box with the 'Batch Sheet Settings' tab selected. The 'Main Units' are 'MT - Metric Tonne' and 'Volume Units' are 'USGAL - US Gallons'. The 'Scale Units' are set to 'USGal'. The 'Conversion' is 1 and 'Decimals' is 0. The checkbox 'Convert Scale Units to/from Liquid?' is checked. The 'Blender Type' is 'Scaled / Metered'. The 'Max Blend Size (in main units)' is 8 and 'Max Volume Size (in vol units)' is 1,250. The 'Show Percentages on Batch Sheet by default' checkbox is checked. The 'Show Blend Notes by default' checkbox is checked. The 'Force Equal Batches by default' checkbox is checked. The 'Adjust Actuals Defaults' section shows 'Product Quantity' selected. The 'Enter values per' section shows 'Blend' selected. The 'Adjust' section shows 'Rate' selected. A table of products is visible on the right.

Product	Product Order
2800 - 28-0-0	1
1034 - 10-34-0	2
0012 - 0-0-12 Bulk	3
150020 - 15-0-0-20	4

Max Volume Size is the capacity of the blender in volume units (in this case, US gallons).

Sample Batch Sheet – Show Gallons

The following is a sample batch sheet for **21 MT of 2800**, with the **Convert Scale Units to/from Liquid?** box checked.

Show Metric Tonnes

Note If you want the batch sheet to show **gallons** instead of metric tonnes, check the **Convert Scale Units to/from Liquid?** checkbox - see **page 17** for an example.

On the **Batch Sheet Settings** tab, specify the **Scale Units**, **Conversion factor**, (which is the conversion factor between the Volume Units and the Scale Units) and default **Products**.

Since you want the batch sheet to show metric tonnes instead of gallons, leave **Convert Scale Units to/from Liquid?** unchecked.

Add Blend Type
